## Abstract

Only the questions with a \* are compulsory (but do all of them!).

## 1 Lagrangian multiplier technique

### 1.1 Unconstrained optimization

Let  $f(x, y) = 2x^2 - 3x + 4y^2 + 4y + 20$ .

Find  $(x^*, y^*) \in \mathbb{R}^2$  such that  $f$  reaches its minimum (i.e.  $f(x^*, y^*) \leq f(x, y) \quad \forall (x, y) \in \mathbb{R}^2$ ).

### 1.2 Constrained optimization
