As a reminder, one step of gradient descent is done using the formula

$$x_{n+1} = x_n - \lambda * f'(x_n)$$

where x_n is the current point, λ is the 'learning rate', and f' (sometimes written $\frac{df}{dx}$) is the derivative of f, f being the function to minimize.

Question 6. Calculate 5 steps of gradient descent with learning rate of $\lambda = 0.8$, starting from $x_0 = -0.25$ for the function $f(x) = x^2 - x + 3$.

Conjecture what is the exact minimum of f^1 ; how far is x_1 from it? and x_4 ?

What happens if the learning rate is $\lambda = 1$? and $\lambda = 2$? and $\lambda = 0.1$? and $\lambda = 0.01$? (do only 3 steps)

¹Plotting $x_0, x_1, x_2, x_3, \ldots$ may help.
